Allowable Subject Matter

1. Claims 1, 4-6 and 9 are allowed.
2. The following is an examiner's statement of reasons for allowance:
3. [Claim 1]: A method of scanning, comprising: exposing, an array of photosensors, to light, a first time; activating a particular section of a charge transfer gate, where the charge transfer gate has a plurality of sections, each section individually controllable, and fewer than all the sections are activated; transferring charges, from a contiguous block of the photosensors, through the particular section of the charge transfer gate, to a charge shift register; exposing, the array of photosensors, to light, a second time; transferring charges, from the contiguous block of photosensors, through the particular section of the charge transfer gate, to the charge shift register, so that charges from the contiguous block of photosensors, from more than one exposure, are interleaved in the charge shift register.
4. [Claim 5]: A method of scanning, comprising: exposing, first and second arrays of photosensors to light; transferring charges, from a first contiguous block of photosensors in the first array of photosensors, to a charge shift register, wherein the block comprises less than all the photosensors, and only charges from the first block are transferred; transferring charges, from a second contiguous block of photosensors in the second array of photosensors, to the charge shift register, where only the charges from the second block are transferred, so that charges from contiguous blocks from more than one array of photosensors are interleaved in the charge shift register.
5. [Claim 9]: A method of scanning, comprising: exposing, first and second arrays of photosensors to light; transferring charges, from a first block of photosensors in the first array of

photosensors, directly to a charge shift register without any intervening charge shift registers, wherein the block comprises less than all the photosensors, and only charges from the first block are transferred; shifting, in the charge shift register, the charges from the first block of photosensors; transferring charges, from a second block of photosensors in the second array of photosensors, directly to the charge shift register without any intervening charge shift registers, into the stages of the charge shift register previously occupied by the charges from the first block of photosensors before shifting, where only the charges from the second block are transferred, so that charges from blocks from more than one array of photosensors are interleaved in the charge shift register.

6. **Discussion of prior art:** US PG-PUB 20010043275 to Hirota teaches in figure 10 that charges are transferred from vertical CCDs to a Horizontal CCD. However Claim 5 recites that “transferring charges, from a first contiguous block of photosensors in the first array of photosensors, to a charge shift register”. In other words, charges from vertical CCD are being transferred to a horizontal CCD and not from photosensors to a charge shift register. The specification and claims are consistent regarding this language. Hirota transfers charges from photosensors to multiple vertical CCDs and not “a charge shift register”.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”
